

Revised 2025 January 28

The “taxonomy” used in this Index is alphabetical within each taxon, and makes no attempt to represent phylogeny. In spite of my decision to do this, I had to make several taxonomic decisions. For example, what names to give to the several lycaenids whose names seem to change with every book that is published? To what families should the “woolly bears” and tiger moths be assigned? Are the Satyridae and Thyatiridae families in their own right, or should they be subsumed in a larger Nymphalidae and Drepanidae? What species names shall I give to our *Coenonympha* and *Celastrina*? In order to complete the Index in the small finite time available to me I allocated not more than about two seconds to each such question (rather shorter than it would have taken to toss a coin), and made each decision with all the authority of an untutored amateur. Thus, there will be several places where viewers do not agree with the chosen names – but that is usual in all natural history taxonomies anyway.

At about the same time that this site was being erected, the moth superfamily Noctuoidea was being extensively revised by Lafontaine and Schmidt in their Annotated check list of the Noctuoidea (Insecta, Lepidoptera) of North America north of Mexico, ZooKeys 40: 1–239 (2010). I have recently re-organized the Index to take account of this new taxonomy. The details of this revision are described at the bottom of this Index. In order to ease the transition from the old taxonomy to the new, I have included subfamilies within the new Erebidae, maintaining the principle of alphabetical order described at the beginning of the previous paragraph. Readers will notice that the once familiar families Arctiidae and Lymantriidae, as well as some of the old Noctuidae, are now part of Erebidae. *Nola* and *Nycteola* have been moved out of Noctuidae to their own family, Nolidae.

The Annotated Taxonomic Checklist (ATC) of the Lepidoptera of North America of Morth America North of Mexico by Pohl and Nanz was published in 2023. This reference maintains the revision of the Noctuoidea described in the previous paragraph. From 2024 the Invertebrate Alert and this Index follow the scientific names and taxonomy of the ATC.

There are doubtless many ways in which the Index could be improved. For example, I have not listed or cross-referenced alternative nomenclatures, nor have I listed English names, and I have not included animals mentioned in the site but not photographed. Apart from disagreements over the taxonomy (which are not really “mistakes”), there are doubtless several mistakes in the Index, and I would be glad if viewers who notice any mistakes to inform me (tatumjb352@gmail.com) so that they can be corrected. I would be particularly glad to be notified of any dates that are wrongly listed. Also any spelling mistakes, or such disastrous mistakes as my having inadvertently listed some butterfly in the Malacostraca or a beetle in the Hymenoptera. We have tried to be as accurate as possible in the identifications of the animals, but, if you believe that we have made any mistakes in the identifications, please get in touch with me. There are several photographs of unidentified insects. You will be able to find these if you ask your

computer to “Find” the word “unidentified” or the abbreviation “sp.”. If you think you can help with the identifications of these, please do let me know.

The fonts that I have used for the several taxonomic layers are **CLASS**
SUBCLASS Order FAMILY SUBFAMILY Genus species. Subfamilies are used mostly only within the moth family Erebidae, in order to try to ease the transition from the old noctuid taxonomy to the new.

Dates in the Index are given in the order year month day.

USING THE INDEX

This note is written to help you use the Index. It is a little tricky, but after a few goes you may get used to it!

Suppose you want to find a photograph of a particular butterfly or other invertebrate, you have to know its scientific name, because all of the creatures are listed by scientific name. Thus, suppose that you are looking for a photograph of the Western Pine Elfin, you have to know its scientific name, which you may know as *Callophrys eryphon*.

Near the left hand side of the Index, you’ll find a small window that says “Search Document”. Type in there the species name eryphon, and click. (You needn’t use italics.) I advise against typing the whole name *Callophrys eryphon*. Invertebrates are often moved by the taxonomists from one genus to another. Indeed in this Index the Western Pine Elfin is listed as *Incisalia eryphon*. Your search will fail if you type *Callophrys eryphon*, but it will succeed if you just type eryphon.

Having found *Incisalia eryphon*, you will find a list of dates under which this species appears. Make a note of the date(s) that you wish to look at, and then go back to the Invertebrate Alert site.

The snag now is that you don’t know on which page to find the entry for the date that you want.

There are two procedures. If the date you are searching for is November 2014 or earlier, go to the bottom of the page. There you will find a list of pages, 1 to 9 and finishing at Next. Click on the largest number (just to the left of Next). At the time of writing this number is 164, but it will probably be larger by the time you read this. When you have done that, you will find yourself at June-July 2014. Go to the bottom of the page, and near the bottom you will find a list of months, which you can click on, and your search will soon be over.

If the date you are searching for is later than November 2014 your search is going to be a little trickier. Let’s suppose that we wish to find the image of *eryphon* on 16 April 08. (This is written in the order year, month, day.) We have no idea which page it is on,

and at the time of writing there are 164 pages. Let's make a wild guess and we'll try and find page 50. Here's a quick way of finding page 50:

Near to top of the Invert Alert page you will find www.vicnhs.bc.ca/?cat=8

Between ? and cat type paged=50& and then click This will take you to page 50, which is for 2017 January 31. You have got to go much further to reach 2016 April 08.

Let's try page 75. Go to the top of the page and change paged=50& to paged=75&

This takes you to 2016 June 14. You've still got a little way to go. It's actually on page 88.

'Fraid this is a bit of a rigmarole, but it's the best we can manage at present. It'll be hard the first time you try it, but after a few goes you may get used to it! If we find a better way sometime, we'll implement it.

ARACHNIDA Acari

In this Index, **This Font** generally means an Order, and for the purposes of this Index we shall treat **Acari** as an Order. However, in current classifications, Acari is probably better treated as a Subclass, within which there are several Orders, which have not yet settled down. If I get a moment one day, I may try and sort the animals below into their new Orders. The animals included in **Acari** are the mites and ticks.

Before 2025, all *Forficula* earwig photographs on this site were labelled *F. auriculata*. It now seems that there exists a cryptic species complex containing several (about four) species, and that the common garden species here (as well as in the UK, where the ones here probably came from) should be labelled *F. dentata*.

As noted above, the superfamily Noctuoidea has recently been extensively revised by Lafontaine and Schmidt in their Annotated check list of the Noctuoidea (Insecta, Lepidoptera) of North America north of Mexico, ZooKeys 40: 1–239 (2010). Here are some of the highlights of the Lafontaine and Schmidt Noctuoidea classification.

The North American Noctuoidea now comprises the following families:

- Doidae
- Notodontidae
- Erebidae
- Euteliidae
- Nolidae
- Noctuidae

Of these, Doidae and Euteliidae are very small families, and I don't know if they have any representatives on Vancouver Island, so I'll say no more about them here.

Notodontidae (the prominent and kitten moths) is largely unscathed, the only new changes being the divisions at subfamilial level, so I'll leave it at that.

It is the remaining families, Erebidae, Nolidae and Noctuidae that need some comments. It will be noticed that some old families and subfamilies have been demoted to subfamilies and tribes respectively, while one group (now called Nolidae) has been promoted to family level.

Erebidae now comprises numerous subfamilies of which I mention just a few. It includes the former Lymantriidae and Arctiidae, as well as the former quadrifid Noctuidae.

Lymantriinae is the old family Lymantriidae, now demoted to subfamilial status. It includes the Vapourer, Satin and Gypsy moths.

Arctiinae is the old family Arctiidae, now demoted to subfamilial status. It includes the tiger moths, large ermine moths and the Cinnabar moth, as well as the lichen-feeding footman moths. The footman moths were formerly subfamily Lithosiinae, but are now demoted to tribe Lithosiini.

The remaining subfamilies of Erebidae are certain groups of moths taken from the old, traditional Noctuidae, mainly what were formerly called the “quadrifid” noctuids. Thus:

Hypeninae. These are the snout moths. They are no longer in Noctuidae, but are now in Erebidae.

Scoliopteryginae. This includes the Herald Moth.

Erebinae. This comprises several tribes of which the Catocalini are the red underwing moths.

Nolidae is now of family status. (It has enjoyed that privilege in the distant past.) Our representative here is *Nola minna*.

Noctuidae. This somewhat reduced family comprises the remainder of the former larger Noctuidae. It largely consists of what were formerly known as the “trifid” noctuids.
